

8 Ways Power Apps Helps you Solve Business Problems

The world is in a dire need of solutions that build apps faster. Power Apps makes that possible with a plethora of benefits.

1. Can be used with a variety of platforms

already used in your organization, and the list is growing.

2. Allows everyone to participate in the design process.

You can choose what goes where in the front-end UX.

3. Produces apps that run on all platforms.

Simplifies the process of distributing your finished app to app stores, reducing testing time.

4. 70% cheaper cost of developing an app,

as it enables in-house development without the need for vendor license or outside expertise.

5. Connects all your critical data

from multiple on-premise or cloud locations in a single app to conduct operations across your organization.

6. Currently provides over 275 connectors

to the most popular enterprise SaaS solutions, including both Microsoft-developed & third-party apps

7. Automates a variety of manual tasks

and provides instant access to your business data with Power Automate.

8. Authenticates and implements security policies.

Apps are instantly linked to Microsoft's active directory domain service in charge of all users and devices.

Types of Power Apps

Power Apps can create three types of apps. Each is appropriate for a variety of situations and end-users.

Canvas Apps

Build a custom business app from scratch or with built-in templates, interaction with the data source, easy-to-use drag & drop controls. Choose screen sizes like Tablet or Mobile.

Model-Driven Apps

Great when you need to use a data model and develop an app very quickly. Easily create and edit forms, charts, and whatever gives an overview of your data.

Portals

Create an anonymous or authenticated, externally-facing website with no-code solutions, & interact with Dataverse data. The same drag-and-drop interface of apps is used to create these rich, dynamic web pages.
