Low-code For Enterprise App Development

What is an **Enterprise Application?**

Complex Business Requirements
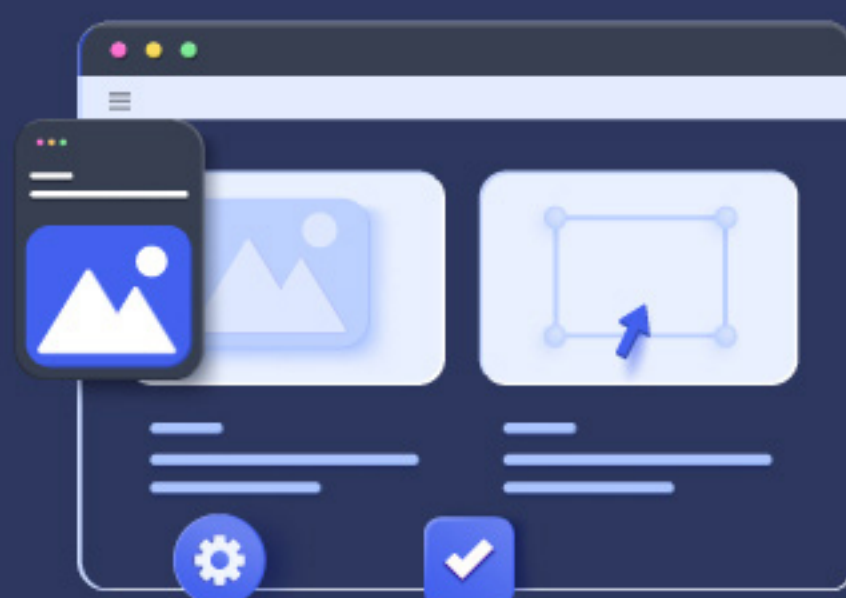

Customized Applications
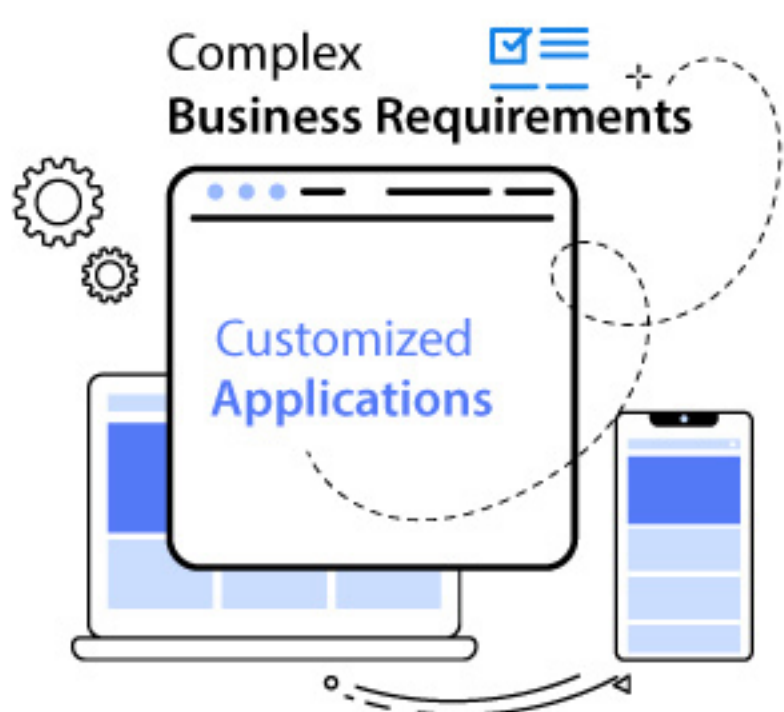

An enterprise application is a software designed for **large businesses that are customized according to their complex business requirements.**

These applications can be deployed on the cloud across various platforms and networks.

Here is why low-code is the best choice
for enterprise application development

Fosters hybrid development teams

Reduces shadow IT

Legacy modernization with microservice applications

Reduces Development Costs

Increases Productivity and efficiency

Rapid prototyping of ideas and solutions for agile development

---

How are Businesses using Low-code?

Businesses are using low-code to develop internal processes, build customer portals and business-critical applications, process automation, and replace, migrate, or extend legacy systems.

With industry-validated skills on Mendix, OmnePresent helps organizations build custom enterprise-grade applications faster and more efficiently.
